

Lens options 101

High index

High index lenses can be up to 50% thinner than regular glass or plastic lenses, and they are usually much lighter. High index lenses bend light more efficiently than regular glass or plastic lenses, so less lens material is required to correct your vision.

Polycarbonate

Polycarbonate lenses are special high index lenses that offer a better eyewear experience in unique situations, such as sports or safety glasses, and are ideal for anyone with an active lifestyle who wants a thinner, lighter lens.

Anti-reflective coating

All eyeglasses reflect some light, which can decrease the amount needed for ideal vision. Anti-reflective coating reduces this effect, improving vision and easing eye strain.

Scratch resistant

No eyeglass lens material is scratch-proof, but a lens that is treated with front scratch-resistant coating has added durability.

Photochromic

Photochromic lenses are convenient indoor / outdoor eyeglass lenses that automatically darken to a sunglass shade outside when exposed to sunlight, and then quickly return to a clear state indoors. These lenses also provide 100% protection from the sun's UV rays.
